

Dryer

Moretto SpA offers XD series high performance and energy saving 'X dryer'. It is a dehumidifying system that gives superior flexibility and process performance. The users of this dryer have to set only two parameters: hourly throughput and material to treat. The dryer automatically manages and controls a series of variable data, observing the specific characteristics of every single

polymer. This system is available in six different sizes with the XD 20 series and airflow from 25 to 350 m³/hr, relative to the residence time of the specific polymer, and achieves a constant dew point of -75°C. The XD 600 series is suitable for big production and has an airflow capacity that can reach up to 2,500 m³/hr.

The dryer saves energy by using it only for the correct treatment of the material and relative to the set throughput. Its variable airflow, constant performance, high dew point, non-usage of cooling water and compressed air, also helps this dryer in saving energy.
