

Mini dryer

Moretto SpA, a leader in the auxiliary equipment production for plastics transformation, represents one of the most reliable and efficient companies in the market. The

technologies offered by Moretto allow many applications with high performance, realising solutions suitable to satisfy requirements of the market.

A product that has obtained a great success is the mini-dryer Dry Air. It is a double tower dehumidifier for small productions, suitable for technical products of small size viz, lens for microcameras, pieces for telephony, etc. This machine is based on the zeolite technology and it is driven by compressed air with self-regenerating double tower. The machine allows the manual regulation of the airflow sent to the hopper. The operator chooses the airflow according to the type of plastics & production requested and the machine monitors the air temperature entering & going out from the hopper. The anti-stress function allows to set a limit temperature for the return air and to reduce the airflow when this temperature is reached to shelter the material from a thermal stress.

The Dry Air range includes four models combined with generators in two different sizes. This machine is very compact and thanks to its size, can be installed directly on the transformer machine. The Dry Air line has seen almost 3,000 machines being sold in 2007, of which more than 1,200 were in Asia. A key installation has been realised for an important Japanese company specialised in the motorbike production. Many installations have also been realised in the electronic components production.
