

Moretto

The Roto Dust Separator is installed directly on the machine throat and is designed to prevent dust problems in the material feed, especially when regrind is present, when producing high quality and technical mouldings.

Available in the UK from Summit Systems, the separator provides a thorough cleaning process that is said to have exceeded expectations in its performance.

Material is checked inside a special rotary basket before passing through a counter-current washing process, which takes air containing the dust from a closed circuit. The suction system uses a single blower.

Other features include a sliding gate that guarantees the air flow and assists with cleaning of the machine. The unit is particularly suitable for medical and food applications.
