

Moretto

Compressed air-driven dehumidifying mini dryers are the latest addition to the range of drying equipment available in the UK from Summit Systems.

Units connect directly to compressed air lines, with air flow regulated by special valves.

Automatically regenerating twin desiccant towers ensure a consistently low dew point and an energy saving device prevents any possibility of over-drying, according to Summit.

Dryer capacity is in the range of 3-12kg per hour. They can be throat-mounted, if required.
