

The company from Massanzago (PD, Italy) at the German trade fair K 2004 with the preview of an innovative machine in the field of dehumidification.

PLASTIC MATERIALS: IN DÜSSELDORF, MORETTO PA ANNOUNCES A REVOLUTIONARY DEHUMIDIFYING DRYER

At the trade fair new projects aiming at the reduction of power consumption and energy saving.

(Massanzago PD – October the 10th 2004) MORETTO PA introduces a preview of a new exclusive dehumidifying dryer in Düsseldorf at the trade fair K 2004, Europe's most important trade fair in the field of plastic and rubber materials. The product is called X DRYER, a machine that establishes a new standard in the field of dehumidification.

“At the Düsseldorf trade fair we shall bring a preview of our revolutionary ‘x series’ dehumidifying dryer” - explains Renato Moretto, the chairman of the company from Massanzago (PD) – X Dryer is the outcome of a long and elaborated project. And it is going to be an innovative machine, for its performances and features, that also establishes a new standard for the reduction of power consumption and energy saving. A product that shall raise our competitiveness in the global market.”

The X DRYER line shall be officially presented and distributed from March 2005.

In the meanwhile, Moretto PA exposes in Düsseldorf a series of products aiming at the reduction of power consumption and energy saving.

DOSING LINE > For what concerns gravimetric dosing units a completion of the DGM Gravimetric dosing line shall be presented, with the 600-800 series, that stand out for the unique shutter-lid system. The final answer for micro-dosage is the whole range of DVR GENIUS micro-dosers, machines that use a unique pulsing feeding micro-dosage system, capable of surgical precision.

DRYING LINE > DRY AIR is a new range of dehumidifying dryers especially designed for small productions. DRY AIR series, in double-tower Zeolite technology, is the most compact and best performing in its category (constant performance in Dew Point -55°C and anti-stress included are the strong points of this series); moreover, this product involves a TMR device: heated maintenance hoppers designed to ensure a constant temperature during the transport of dehumidified materials.

GRINDING LINE > Moretto also introduces innovations in the new GR VARIANT series, a unique solution that permits an entirely dustless grinding of soft materials. VARIANT can be equipped with a water-cooling system for the machine body for the treatment of hot sprues and soft materials. ROTO DUST, a Moretto exclusive solution, is a dust collector that can be applied directly to the moulding machine and perfectly integrable with the feeding line products.

COOLING LINE > A new compact unit is added to the water TOOL TEMPERATURE CONTROLLERS family, a new basic temperature controller entirely made of stainless steel, which is provided with a remote control as well as high heating and chilling

performances. To complete the series, the entire range of Moretto PA COMBI CHILLERS, machines with a chilling power ranging from 40 to 200 kW, with the highest COP (coefficient of performance) among equipment available on the market, that can cope with the most demanding applications.

MOWIS (Moretto Objects Windows Information Supervising) is Moretto's proposal for supervising systems. In complex systems, MOWIS simplifies the user interface by

translating character data into a graphic form and making information management easier. The exclusive feature of MOWIS is its simplicity of use, thanks to a user-configurable object-format menu. MOWIS is an open system that can be implemented without any service charge.
